(LA)MCP-4 IS ABOUT 30 FOLD LESS ACTIVE THAN MCP-4. SIMILARITY: BELONGS TO THE INTERCRINE BELA FAMILY (SMALL CYTOKINE SIMILARITY: BELONGS TO THE INTERCRINE BELA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         POWER C.A., MEYER A., RISON S.C.G., GUYE-COULIN F., WELLS T.N.C.;
SUBMITTED (DEC-1997) TO EMBL/GENBANK/DDBJ DATA BANKS.
-1- FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTE MONOCYTES, LYMPHOCYTES,
-1- FONCTION: CHEMOTACTIC, BUT NOT NEUTROPHILS. SIGNALS THROUGH
EASOPHILS AND CRS RECEPTORS. PLAYS A ROLE IN THE ACCUMULATION OF
LEUKOCYTES AT BOTH SIDES OF ALLERGIC AND NONALLERGIC INFLAMMATION.
MAI BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTPERIAL
WALL DURING THE DISEASE PROCESS OF ARTHEROSCIEROSIS. MAY PLAY A
ROLE IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MASS SPECTROMETRY: MW-9314; MW_ERR=30; METHOD=MALDI; RANGE=17-98.
MASS SPECTROMETRY: MW-9860; MW_ERR=30; METHOD=MALDI; RANGE=22-98.
MASS SPECTROMETRY: MW-8575; MW_ERR=30; METHOD=MALDI; RANGE=24-98.
INDUCTION: BY INTERLEUKIN-1 AND THY-ALPHA.
TISSUE SPECIFICITY: WIDELY EXPRESSED. FOUND IN SMALL INTESTINE,
THYMUS, COLON, LUNG, TRACHEA, STOMACH AND LYMPH NODE. LOW LEVELS
SEEN IN THE PULMONARY ARTERY SMOOTH MUSCLE CELLS.
MEDILNE: 97341179.

#title Two inflammatory mediator cytokine genes are closely linked and variably amplified on chromosome 17q.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ##Cross references EMBL.X52149; NID:g34750; PID:g296666
This protein is a member of a "small inducible" or "activation specific" gene family, is likely to be an early-acting interleukin, and is the product of a putative G0/G1 switch gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    #authors Blum, S.; Forsdyke, R.E.; Forsdyke, D.R.

Isolation and characterization of a cDNA encoding a putative
cytokine which is induced by stimulation via the CD2
structure on human T lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             U.

J. Immunol. (1989) 142:1582-1590

Mitogenic activation of human T cells induces two closely related genes which share structural similarities with a new family of secreted factors.

This protein is secreted by activated lymphocytes and monocytes. It is bound by chemokine (C-C) receptor 5 (see PIR:A43113) and receptor 1 (see PIR:A45177).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      #journal Int.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                      providing better tissue penetration.

Example 23; Page 58; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-
lalpha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
properties: leading to enhanced productivity and greater therapeutic
utility as stem cell protective agents. The analogues may be used
proliferative stem cells.

Most pref. LD78 analogues are Phel2>Gln; Lys44>Ser, Arg17>Glu (with
Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser, Pref. MIP-lalpha
analogues correspond to the pref. LD78 analogues.

Protein with stem cell inhibition activity, e.g. LD78 or MIP-1

Through a unable to form stable multimer higher than dodecamer,

Through a providing better tissue penetration

Example 58, Page 71; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-

Calpha, having mutations to prevent or reduce multimer formation

beyond certain stages (e.g. dodecamer), have improved solution

Competities leading to enhanced productivity and greater therapeutic

utility as stem cell protective agents. The analogues may be used

to tundour therapy, psoriasis or other diseases involving hyper-

Most pref. LD78 analogues are Phel2>dln, Lys44>Ser, Arg1>clu (with

analogues correspond to the pref. LD78 analogues.
                 proliferative stem cells.

Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg17>Glu (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha analogues correspond to the pref. LD78 analogues.

Sxample 13: page 54: 294pp; English.

Sxample 13: page 54: 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-1 alpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution beyond certain stages (e.g. dodecamer), have improved solution to properties leading to enhanced productivity and greater therapeutic utility as stem cells.

In tumour therapy, psoriasis or other diseases involving hyperic in tumour therapy, psoriasis or other diseases involving hyper.

Most pref. LD78 analogues are Phel2>Gln, Ly844>Ser, Arg1>Gln (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha

protein with stem cell inhibition activity, e.g. LD78 or MIP-1

providing better tissue penetration

Example 30; Page 61; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-

lalpha, having mutations to prevent or reduce muttimer formation

beyond certain stages (e.g. dodecamer), have improved solution

properties leading to enhanced productivity and greater therapeutic

utility as stem cell protective agents. The analogues may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

protein with stem cell inhibition activity, e.g. LD78 or MIP-1 alpha - unable to form stable multimer higher than dodecamer, alpha - unable to form stable multimer higher than dodecamer, providing better tissue penetration seem of natural stem cell inhibitors, such as LD78 and MIP-2 handogues of natural stem cell inhibitors, such as LD78 and MIP-3 handogues of natural stem cell inhibitors, such as LD78 and MIP-3 handogues of natural stem of prevent or reduce multimer formation contains stages (e.g. dodecamer), have improved solution properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used to tunity as stem cells. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyperproliferative stem cells.

Continerative stem cells.

Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg17>Glu (with Gln18>Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                             providing better tissue penetration Example 7: Page 52: 294pp; English.
Analogues of natural stem cell inhibitors, such as LD78 and MIP-lalpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used un tumour therapy, psoriasis or other diseases involving hyperproliferative stem cells.

Proliferative stem cells.

proliferative stem cells.

Glil85Glu, and, esp., Asp65Aala and Glu66>Ser. Pref. MIP-lalpha analogues correspond to the pref. LD78 analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                        WPI; 93-227322/28. Protein with stem cell inhibition activity, e.g. LD78 or MIP-1 alpha - unable to form stable multimer higher than dodecamer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Protein with stem cell inhibition activity, e.g. LD78 or MIP-1
Thought - unable to form stable multimer higher than dodecamer,
Throughing better tissue penetration
Example 5: Page 51; 294pp; English.
Analogues of natural stem cell inhibitors, such as LD78 and MIP-
Callapha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
properties leading to enhanced productivity and greater therapeutic
cutility as stem cell protective agents. The analogues may be used
proliferative stem cells.
Most pref. LD78 analogues are Phel2>Gln, Ly844>Ser, Arg17>Glu (with
canalogues correspond to the pref. LD78 analogues.

                           Example 12; Page 54; 294pp; English.

Example 12; Page 54; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-
halpha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
properties leading to enhanced productivity and greater therapeutic
utility as stem cell protective agents. The analogues may be used
proliferative stem cells.
                                                                                                                                                                              Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg17>Glu (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha analogues correspond to the pref. LD78 analogues.

                                                                         δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein with stem cell inhibition activity, e.g. LD78 or MIP-1 alpha - unable to form stable multimer higher than dodecamer, alpha - unable to form stable multimer higher than dodecamer, providing better tissue penetration.

Example 4: Page 51: 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-
(1 alpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution to properties leading to enhanced productivity and greater therapeutic utility as stem cells protective agents. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyper.

Crost for the cells.

Considerative stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                             providing better tissue penetration
Example 29; Page 60; 294pp; English.
Analogues of natural stem cell inhibitors, such as LD78 and MIP-
lalpha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
properties leading to enhanced productivity and greater therapeutic
utility as stem cell protective agents. The analogues may be used
in tumour therapy, psoriasis or other diseases involving hyper-
                                                                                                                                                                                                                                                                                                                                                   proliferative stem cells.

Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg1>Glu (with Gfn18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha analogues correspond to the pref. LD78 analogues.

protein with Stem cell inhibition activity, e.g. LD78 or MIP-1 alpha - unable to form stable multimer higher than dodecamer, alpha - unable to form stable multimer higher than dodecamer, providing better tissue penetration providing better tissue penetration sample 18; page 56; 294pp; English.

25 Example 18; page 56; 294pp; English.

26 Analogues of natural stem cell inhibitors, such as LD78 and MIP-1 alpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution beyond certain stages (e.g. dodecamer), have improved solution to properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyperintiative stem cells.

26 In the contrastive stem cells.

37 Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Argl7>Glu (with Gln18>Glu18>Glu1 and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha

Analogues of natural stem cell inhibitors, such as LD78 and MIP-lalpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyper-Most pref. LD78 analogues are Phel2>Gln 1844>Ser, Arg17>Gln 18>Gln and esp. Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha Sequence 69 AA; 8888888888888

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -!- FUNCTION: MONOKINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.

BASOPHILS, AND LYMPHOCYTES. REQUIRED FOR LUNG TNF-ALPHA

PRODUCTION, NEUTROPHIL RECRUITEMENT AND SUBSCUENT LUNG INJURY AND

MAY FUNCTION AS AN AUTOCRINE MEDIATOR FOR THE MACROPHAGE

PRODUCTION OF TNF-ALPHA WHICH IN TURN UP-REGUIATES VASCULAR

PHOBESION MOLECULES REQUIRED FOR NEUTROPHIL INFLUX. THIS PROTEIN

(LA)MCP-4 IS ABOUT 30 FOLD LESS ACTIVE THAN MCP-4. SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE
                                                                                                                                                                                                                                                                                                                                              POWER C.A., MEYER A., RISON S.C.G., GUYE-COULIN F., WELLS T.N.C.;
SUBMITTED (DEC-1997) TO EMBL/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: CHENGATACTIC FACTOR THAT ATTRACTE NONOCYTES, LYMPHOCYTES,
-EDASOPHILS AND EOSINOPHILS, BUT NOT NEUTROPHILS. SIGNALS THROUGH
CCR2B AND CCR3 RECEPTORS. PLAYS A ROLE IN THE ACCUMULATION OF
LEUKOCYTES AT BOTH SIDES OF ALLERGIC AND NONALLEGRIC INFLAMMATION.
MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL
WALL DUBING THE DISBASE PROCESS OF ARTHEROSCLEROSIS. MAY PLAY A
ROLL IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MASS SPECTROMETRY: MW-9314; MW_ERR=30; METHOD=MALDI; RANGE=17-98.
MASS SPECTROMETRY: MW-8760; MW_ERR=30; METHOD=MALDI; RANGE=22-98.
MASS SPECTROMETRY: MW-8775; MW_ERR=30; METHOD=MALDI; RANGE=24-98.
INDUCTION: BY INTERLEUKIN-1 AND THE-ALPHA.
TISSUE SPECIFICITY: WIDELY EXPRESSED. FOUND IN SMALL INTESTINE, THYMOS, COLON, UND, TRACHEA, STOMACH AND LYMPH NODE. LOW LEVELS SEEN IN THE PULMONARY RATERY SMOOTH MUSCLE CELLS.
          MEDITION, 97341179.

PORSSAANN W.-G. 1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

IL SUMPLITUD (OCT-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

INTRACELLULAR KAZY CATIVITIES ON HUMAN MONOCYTES AND ACTS VIA

RECEPTORS THAT ALSO RECOGNIZE MIP-1 ALPHA. IT INDUCED

INTRACELLULAR CA2+ CHANGES AND ENZYME RELEASE, BUT NO CHEMOTAXIS,

AT CONCENTRATIONS OF 100-1,000 NM, AND WAS INACTIVE ON T

INTRACELLULAR TONS OF 100-1,000 NM, AND WAS INACTIVE ON T

INTRACES. SPLEBAL INTERNATIONS CELLS.

C.I. TISSUE SPECIFICITY: EXPRESED CONSTITUTIVELY IN SEVERAL NORMAL

TISSUES: SPLEBEN, INTER, SKELETAL AND HEATH MOSCLE, GUT, AND BONE

MARROW, PRESENT AT HIGH CONCENTRATIONS (1-80 NM) IN PLASMA.

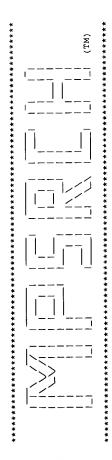

C.-S. (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;
